

Spontaneous symmetry breaking and field-theory I

Alejandro Muramatsu
Institut für Theoretische Physik III
Universität Stuttgart

Wintersemester 2013/14

Contents

1	Phenomenology of spontaneous symmetry breaking	5
1.1	Introduction	5
1.2	Phase transitions of first and second order. Order-parameter	7
1.3	Criticality, critical exponents and universality	9
1.4	Thermodynamic description of phase transitions	11
2	Landau's theory of phase transitions	13
2.1	Second-order phase transitions	13
2.2	First-order phase transitions	21
2.3	Discussion of Landau's theory of phase transitions	25
3	Mean-field theory	27
3.1	The Ising model	27
3.1.1	Definition of the model	28
3.1.2	Symmetries of the model	29
3.1.3	Other application of the Ising model	31
3.2	Mean-field approximation for the Ising-model	33
3.2.1	Order parameter close to T_c	36
3.2.2	Critical isotherm	37
3.2.3	Isothermal susceptibility	37
3.2.4	Correlation length and correlation functions	38
3.3	Relationship between Landau's theory and mean-field theory	40
3.3.1	Landau's functional for the Ising model	40
3.3.2	The saddle-point approximation	46
3.4	The large- N limit	50
3.4.1	Infinite range Ising-model	50
3.4.2	N -component vector model and the large N -limit	52
3.5	Corrections to mean-field. The Ginzburg criterion	62

4	Introduction to renormalization group theory	75
4.1	Real-space renormalization group	76
4.1.1	Calculation of the correlation length	83
4.2	General Theory	85
4.2.1	Scaling behavior and critical exponents	87
4.2.2	Scaling for correlation functions	90
