Exercise 1 - Fermionic Commutation Relations

Consider the Hamiltonian for the H$_2^+$ molecule in second quantization
\[ H = E_0(c_1^\dagger c_1 + c_2^\dagger c_2) - t(c_1^\dagger c_2 + c_2^\dagger c_1), \]
where $c_{1,2}$ are Fermionic annihilation operators for electrons at the proton positions 1, 2, $E_0$ is the ground state energy of the system when the two protons are infinitely apart, and $t$ is the hopping of electrons between positions 1 and 2.

(a) Define new Fermionic (A)nti-bonding and (B)onding operators as
\[ c_A = \frac{1}{\sqrt{2}} (c_1 - c_2), \]
\[ c_B = \frac{1}{\sqrt{2}} (c_1 + c_2), \]
and show that they obey anti-commutation relations;

(b) Prove that in terms of the new variables the Hamiltonian reads
\[ H = (E_0 + t)c_A^\dagger c_A + (E_0 - t)c_B^\dagger c_B. \]

Exercise 2 - Tight binding chain in second quantization

Consider a 1D tight binding model with $N$ sites and periodic boundary conditions. The Hamiltonian is given by
\[ H = -t \sum_{n=1}^{N} (a_n^\dagger a_{n+1} + a_{n+1}^\dagger a_n) \]
where $t$ is the hopping matrix element between neighbouring sites. $a_n^\dagger$ and $a_n$ are creation- and annihilation operators for (spinless) Fermions at site $n$.

(a) Show that the particle number operator $N = \sum_n a_n^\dagger a_n$ commutes with the Hamiltonian.

(b) Diagonalize the Hamiltonian by means of an appropriate operator transformation.

(c) Check that the new creation and annihilation operators $c_k^\dagger, c_k$ also satisfy canonical anti-commutation relations.

(d) Show that $[n_k, c_{k'}^\dagger] = \delta_{k,k'} c_k^\dagger$ and derive the commutator of $H$ with $c_k^\dagger$.

(e) Using (d), show that if $|E\rangle$ is an eigenstate of $H$ with energy $E$, then $c_k^\dagger |E\rangle$ is also an eigenstate with energy $E + \epsilon(k)$, where $\epsilon(k)$ is the single particle tight binding dispersion.
